## New single layer jars at TKK

PET, one of the mostly highly-recycled materials in the world, is being used more and more as a replacement for other materials traditionally linked to particular products. TKK provides many interesting and useful products designed to replace standard packaging that has been linked to specific lines in consumers' minds. The company's new jars provide a recyclable and inexpensive solution for products in the personal care and cosmetic sectors.

Made of PET, the jars come in a variety of sizes with the standard colour being white. All of the screw caps are designed to fit on a variety of volumes and feature a cool new look created by applying colour spray painting that includes a UC coating. TKK's colour spray technology is remarkably advanced, enough to create a colourful, shiny metalized look comparable to genuine metallization, perfect for the prestige and masstige markets.

All of TKK's products are available fully customized and decorated according to the client's wishes and shipped internationally.
