

Sprinkle liner

'Development and production of closures and closing concepts for packaging'

Press to open

Cap with sprinkle liner is a light-weight PP closure with an inlay that is perforated with a dosing hole. After pressing the perforation the content can be dosed, such as for example coffee creamer. The benefit of this system is, that with minimal use of materials, a maximum of convenience is created. The cap is 30% lighter in weight than conventional caps. The sprinkle liner also has the function of a sealing, the user must push through the perforation before sprinkling. Existing systems are mostly two-piece of plastic caps with an inlay, the reduction lies in the minimum use of packaging materials. It fits in the trend of lightweight PET containers for sprinkle products such as creamer, sweetener, spices, etc.
